Jiri Blaska's Proposal to Style and Accuracy Committee:

I propose the implementation of the video recording (slow motion) for better evaluation of the sporting performance – the same way as it works in many other kinds of sports. I suggest that Style and Accuracy Committee prepares the change of the SA Competition Rules the way that the Event Judge, if necessary, could use the video recording (slow motion) of the first point of landing.

Explanation: The reason for this is to use all the possibilities of objective evaluations at the Accuracy Landing event. This is not about whether someone can see well or bad, as some of the judges think. An eye is a human organ which has its limitations. A high speed video camera can show us the moments which cannot be observed by a human eye in a real time. We all know that during competitors' landing some controversial situations happen and we cannot prevent these. However, we can provide the judges with all accessible means of the most objective evaluation.

The video camera would be for Event Judge's use. Event Judge will decide when the video recording (slow motion) will be used. Event judge can postpone making the result decision until he or she watches the video recording (slow motion). Event Judge approves the way of making the recording (e.g. a camera on tripod, a special cameraman, a judge with a camera on the cap). It is not possible to make a protest about the Event Judge's decision.

Event Judge would have the authority to make these decisions for a probationary period to be able to ensure the objective and proper course of the competition.

On the other hand, this way we can develop and introduce the best way of recording (slow motion) the first point of landing.

Examples: a goal in the ice hockey – the best example when a referee considers the use of video recording. Can you think of any other kinds of sports when the video recording (slow motion) helps the judges make decisions?
